

Table 1: Green tea for cancer prevention

Source: Karen Pilkington, CAM-Cancer Consortium. Green tea for cancer prevention [online document]. <http://cam-cancer.org/en/green-tea>, date 2020.

<p>General review characteristics: Filippini T, Malavolti M, Borrelli F, Izzo AA, Fairweather-Tait SJ, Horneber M, Vinceti M. Green tea (Camellia sinensis) for the prevention of cancer. Cochrane Database of Systematic Reviews 2020, Issue 3. Art.No.: CD005004. DOI: 10.1002/14651858.CD005004.pub3</p>				
<p>Type of review: Cochrane review</p> <p>Search strategy: dates, databases, restrictions: Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE (Ovid) Embase (Ovid), to January 2019; Amed, CancerLit, PsycInfo and Phytobase. to January 2009; also reference lists and reviews for non-English language papers; Clinical trials registry</p> <p>Quality assessment: Cochrane risk of bias and Newcastle-Ottawa Scale</p> <p>Measure of treatment effect: Risk ratio (RR) for dichotomous outcomes (i.e. cancer risk), for experimental and nonexperimental studies; Mean difference for continuous outcomes (evaluation of quality of life scores)</p> <p>Data synthesis: meta-analysis</p>	<p>Studies: n and design (e.g. RCT) 142 epidemiological studies of 11 experimental and 131 nonexperimental design</p> <p>Participants: n and diagnosis 1795 participants in experimental studies ; over 957,000 participants in cohort studies and 47,973 cases and 130,306 referents in case-control studies</p> <p>Cancers of the digestive tract and the female reproductive system, breast, prostate, kidney and urinary tract, nasopharynx, lung, blood, skin, thyroid and brain.</p>	<p>Intervention: Consumption of green tea or green tea extract (only monotherapy preparations for oral consumption in liquid, powder or tablet form). (green tea is defined as non-fermented tea leaves, and studies had to mention that green tea, non-fermented tea or 'matsu-cha' had been consumed)</p> <p>Control: placebo for intervention studies; different levels of consumption for nonexperimental studies</p> <p>Outcome measures: Cancer risk: number of participants developing cancer (incidence); number of participants dying from cancer (mortality). Quality of life</p>	<p>Results for outcome measures: Cancer risk: Findings were found to be inconsistent with limited evidence of a benefit for overall cancer risk or for risk of specific cancers.</p> <p>Quality of life: Three studies found quality of life was slightly improved in the intervention group compared to the placebo group and one found no difference.</p> <p>Adverse effects: Several side effects were associated supplemental intakes of green tea: most commonly gastrointestinal disorders (mild-to-moderate nausea, diarrhoea, constipation and reflux), raised liver enzymes, insomnia and dizziness, frequency of hypertension, rash and allergic skin reactions.</p> <p>Results quality assessment: The 11 RCTs were judged to be high quality were generally of high quality (low- or very low-certainty evidence from both experimental and nonexperimental studies)</p> <p>Conclusions: <i>'A beneficial effect of green tea consumption on cancer prevention remains unproven so far. Caution is advised regarding supplementation with high-dose green tea extracts due to the possible adverse effects.'</i></p>	<p>Any other comments: Interpretation of the risk ratios and corresponding confidence intervals.</p>
